

Sability apps for workbrain™

Workforce Management Toolkit

Sability's WFM Toolkit is designed to automate some of the most complex and time consuming administrative functions of the Workbrain solution.

Data Management - Archive/Purge

Every day your Workbrain database accumulates valuable data, keeping your organization running efficiently. But, over time the volume of data can become overwhelming, forcing difficult tradeoffs between application performance, functionality and cost controls.

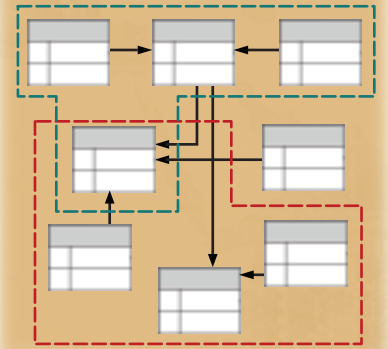

The WFM Data Management app provides a superior solution for archiving your Workbrain data. It comes pre-configured for your

Workbrain database and includes advanced features like reversible archiving, per-table archiving statistics, validation steps prior to committing data changes and is the only Workbrain archiving solution to deliver an undo feature for both archive and purge actions.

Quick Refresh - Environment Management

All system administrators fight a constant battle trying to manage multiple development, training, testing and production environments for their Workbrain system. How can you make sure your test environment matches your production environment? What about the test or training data the team spent countless hours creating? How can you synchronize your configurations without overwriting these valuable transactions?

The Quick Refresh app makes it easy to synchronize data between Workbrain environments. The app comes pre-configured for all core Workbrain data groups and allows administrators to control exactly which data is migrated. This results in much smaller volumes of data to transfer, which allows for faster environment refreshes and smaller hardware requirements for non-production environments.

Time Capture

Extract Errors - Rapid Issue Resolution

When a production issue is reported, the first step to resolution is usually to try to recreate the problem in a test environment. But, given the hundreds of tables in your Workbrain system, it is often difficult to completely recreate the exact same data scenario. This trial and error approach to issue resolution costs both time and money and is completely unnecessary.

The Time Capture app allows administrators to extract all of the relevant transaction and configuration data for a list of employees over a selected period of time. The data is then easily imported into a test environment for diagnosis and resolution.
